

BIRLA INSTITUTE OF TECHNOLOGY AND SCIENCE, PILANI
BIO F417, BIOMOLECULAR MODELING
FIRST SEMESTER 2017 – 2018
MID-SEMESTER EXAM (CLOSED BOOK)

Full marks: 50 DATE: 12.10.17 DURATION: 90 Mins.

- Answer to the point
- Irrelevant and verbose answer may attract penalty
- Steps in each calculation carry marks

1. Write notes on: i) Z-DNA ii) γ -turn iii) RNA secondary structure iv) Levintal's paradox and possible solution v) Template selection in Comparative (homology) modeling. [2X5=10]

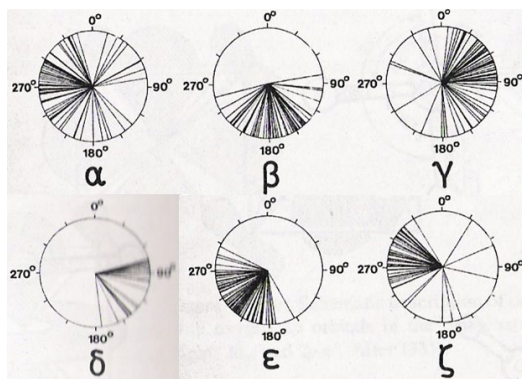

2. a) Show with proper diagram structure of Ala-Ala-Ala-Ala with following combination of phi(ϕ), psi (ψ) and omega (ω) with LLDL configuration of successive alanines. [5]
 (-,180°, 180°), (0°,180°,180°), (180°,0°,0°), (180°,,-,-)

b) Explain the fact that helical structure of collagen is much more stable than α -helix though it contains prolines and glucines. [2.5]

c) Peptide nucleic acid (PNA) is artificially synthesized polymer invented by scientists in 1991. The basic structure of PNA is shown in following diagram. Compare all possible stability aspect of PNA/DNA duplex and DNA/DNA duplex (both in vitro and in vivo condition). [2.5]

3. a) Justify the following observed torsion angles of standard B-DNA backbone with appropriate Newman projection diagram. [5]

- b) Justify the fact that among different dinucleotide steps, pyrimidine-purine step is more flexible. [2.5]
- c) Account all structural changes those lead to transformation of a B-DNA structure to A-DNA. [2.5]
4. a) Explain hydrophobic collapse and folding funnel theory of protein folding. What are the major differences of these two theories? [3]
- b) What are the major conclusions of Anfinsen's experiments? What is the basis of such conclusions? [2]
- c) What are the two major steps of comparative modeling? Explain why. [3]
- d) Why *ab-initio* technique is less successful in protein structure modeling? [2]
5. a) Explain why typical probe radius of 1.4 Å is used to estimate solvent accessible surface area of biomolecules. [1]
- b) Draw Watson-Crick base pair scheme of GC and AT pair and indicate minor and major groove site. [3]

- c) The following two diagrams (A and B) represent base pair orientation of DNA double helix. Mention all non-zero basepair, step and helical parameters of each of these arrangements. The base pairs are represented by standard convention. [2]

A

B

- d) What information can be retrieved by the following graphical model of protein? [2]
- (i) Stick diagram (ii) Space-fill diagram (iii) Ribbon diagram (iv) Wire-frame diagram
- e) What would be the common features of proteins that interact with DNA? [1]
