

**Birla Institute of Technology & Science, Pilani**  
**Pilani Campus**  
**I Semester, 2022-2023**  
**CHEM F4222 Statistical Thermodynamics**  
**Mid Semester Test (Open Book)**

**Max. Marks: 35**

**1 Nov 2022**

**Duration: 1hr 30 min.**

**Instructions to the student:**

- 1) There are five questions in total; answer all the questions.
- 2) Start answering each question on a fresh page and answer all parts of a question together.
- 3) Write brief answers to the point with proper justification.
- 4) Data required are available in Text and/or Reference books. However, for quick reference the following constant values are given.

**DATA:**  $R = 8.3145 \text{ J mol}^{-1} \text{ K}^{-1}$ ;  $R = 0.0820575 \text{ L atm K}^{-1} \text{ mol}^{-1}$ ;  $k = 1.38065 \times 10^{-23} \text{ J K}^{-1}$ ;  
**Avogadro's Number** =  $N_A = 6.022142 \times 10^{23} \text{ mol}^{-1}$ ;  $h = 6.626069 \times 10^{-34} \text{ J s}$ ;  
 $e = 1.60216 \times 10^{-19} \text{ C}$ ;  $m_e = 9.10938 \times 10^{-31} \text{ kg}$ ;  $F = 96485.34 \text{ C mol}^{-1}$ ;  
 $c = 2.99792458 \times 10^8 \text{ m s}^{-1}$ ;  $\epsilon_0 = 8.854188 \times 10^{-12} \text{ C}^2 \text{ N}^{-1} \text{ m}^{-2}$ ;  $g = 9.807 \text{ m s}^{-2}$ .

1. (a) Determine whether the following functions are homogeneous or not; If homogeneous find out the degree of the function. [4]

(i)  $f(x) = 4x^3$

(ii)  $f(x, y) = a^x b^y - xy$

(iii)  $f(x, y, z) = ax^2/y + bz + cz^2/x + dy$

(iv)  $f(z) = z^3 + \cos z + i \sin z$

(b) Consider a function  $f(x, y, z) = 2x^2 + 8y^2 + z^2$  subject to the constraint  $g(x, y, z) = 6x + 4y + 4z - 72 = 0$ . Write down the equations using the Lagrange multiplier method that is required to determine the extremum value of the function  $f(x, y, z)$ . [3]

2. Assume four systems (microstates), A, B, C, D belong to an ensemble. Each system can have the possible energy states of  $E_1 = 1 \text{ kT}$ ,  $E_2 = 2 \text{ kT}$ , and  $E_3 = 3 \text{ kT}$ . Suppose further that there are just three distributions which satisfy the conditions of namely,  $\sum_j a_j = 4$ , and  $\sum_j a_j E_j = 8$ ;

Energy → Distribution ↓	$E_1$	$E_2$	$E_3$
1 <sup>st</sup>	$a_1 = 1$	$a_2 = 2$	$a_3 = 1$
2 <sup>nd</sup>	$a_1 = 2$	$a_2 = 0$	$a_3 = 2$
3 <sup>rd</sup>	$a_1 = 0$	$a_2 = 4$	$a_3 = 0$

(a) Determine the number of ways one may have the 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> distribution.

(b) What is the probability of observing  $E_3$  in the 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> distribution?

(c) Determine the over-all probability of observing  $E_3$ . [7]

3. (a) Show that entropy of a system in the grand canonical ensemble can be written as

$$S = -k \sum_N \sum_j P_{Nj} \ln P_{Nj}$$

where  $P_{Nj} = \frac{\exp(-\beta E_{Nj} - \gamma N)}{\sum_N \sum_j \exp(-\beta E_{Nj} - \gamma N)}$ . [4]

(b) The isothermal-isobaric partition function of an ideal-monoatomic gas is

$$\Delta = \left[ \frac{(2\pi m)^{3/2} (kT)^{5/2}}{ph^3} \right]^N$$

Derive an expression for chemical potential based on the above partition function. [3]

**P.T.O.**

4. (a) Write down the terms, corresponding levels and the degeneracies of each level for the excited state configuration of He,  $1s^1 2p^1$ . [3]

(b) Calculate the rotational contribution to the entropy of HD at 20 K, 100 K and 300 K using appropriate formulae, given that the  $\theta_{rot}$  of HD is 42.7 K. [4]

5. (a) Derive an expression for the ratio of ortho to para populations of  $(^{14}\text{N})_2$  in terms of rotational parameters and temperature (Nuclear spin (I value) of  $^{14}\text{N} = 1$ ). Based on the data given in Table 6.1. of Text Book predict this ratio at 30 K and 300 K. [4]

(b) Fraction of the molecules in the  $j$ th rotational level can be defined as

$$f_j = 2J(J + 1) \left( \frac{\theta_{rot}}{T} \right) e^{-\theta_{rot}J(J+1)/T}$$

Assuming  $J$  is continuous get an expression for  $J_{max}$  value of  $J$  for which  $f_j$  is maximum. [3]
